

PROPERTY MAINTENANCE • MEASURED TRUE

Every hour, every receipt, every door — reconciled.

Property-maintenance companies run on hand-kept pay logs, rent rolls, and P&L sheets that never agree. Caliper turns them into one connected, encrypted ledger — and makes **labor cost per door** a number you can finally trust.

caliper.solutions

The books say one thing. The field did another. Nobody can prove which.

Rent is tracked to the dollar. Labor — the largest controllable cost in the building — lives in pay logs, texts, and memory. When an owner asks what a unit actually cost to maintain, the honest answer is a guess.

How it works today

- × Pay logs in one spreadsheet, rent roll in another, P&L in a third — none of them tied together.
- × Labor gets split across buildings by hand, in cell comments, weeks after the work.
- × Payroll reconciled from memory and margin notes — no audit trail, and hours that never land on a building at all.
- × Cost per unit is a guess, so pricing, staffing, and renewals are guesses too.

How Caliper does it

- **One ledger.** Every timer, receipt, lease, and building expense in the same system.
- **Hours self-allocate** to the doors they were spent on — in the field, as they happen.
- **A true per-building P&L** that reconciles automatically, the moment a timer closes.
- **Encrypted, role-scoped, mobile-first** — for the crew who never had software.

The field is finally instrumentable. The ledger it feeds is still open.

The wedge is labor — the largest controllable cost in maintenance, and the one nobody can currently see per door. Three things changed at once.

01 • THE CREW

Every crew carries a smartphone.

The people creating the cost can now clock in, dictate a work order, and snap a receipt at the door — the field is instrumentable for the first time.

02 • THE COST LINE

Labor is under the most pressure
and the least measured.

Wages moved faster than rents. Owners are asking what maintenance costs per door, and the industry's honest answer is still a spreadsheet estimate.

03 • THE GAP

Systems of record own
the books, not the field.

Accounting platforms treat maintenance as an afterthought, and coordination tools read spend from invoices. The operational ledger between them is open.

Excel-native

IMPORT, ANY SHAPE

One connected ledger, from the timer in the field to the P&L per door.

Measure the hour where it happens. Reconcile it the moment it closes. Prove the cost per door without a single spreadsheet.

01 • FIELD

Measure the hour

Crews clock in with a geofenced, hands-free timer and snap receipts — real hours and materials, on the right door.

02 • ALLOCATE

Reconcile it

Every hour and dollar lands on the building and unit it was spent on. The allocation engine does the math when the timer closes.

03 • PROVE

See the true cost

Per-door P&L, forecasts, and statements that assemble themselves — the number nobody else in the category can produce.

PRO • OFFICE DASHBOARD • SAMPLE DATA

Everyone in the building, priced to the person using it.

Three products, one backend. Pro is the buyer and the system of record; Enterprise is the same buyer one layer up; Community is free with Pro and makes the building sticky.

HOW CAM WORKS

A building's **measured** operating cost — labor plus materials — is allocated pro-rata by rentable square footage across its commercial tenants, then trued up against the CAM each was billed. Per-tenant, branded, print or PDF.

07 / 17

Caliper Community — the building's residents, on the same ledger.

Every competitor treats the resident as a ticket submitter. Community binds each resident to a unit that already exists in Pro's rent roll — so a repair reported from a door lands in the office's queue already knowing its building, unit, and owner.

THE OFFICE SIDE LIVES IN PRO

Requests queue for QR intake, a Residents queue to verify claims against the lease, and staff-authored handbooks and amenities — nothing new to buy, nothing new to learn.

WHY IT'S FREE

One QR, every door: Community spreads inside a building on its own, lands the account for Pro, and makes switching software mean unplugging the building from itself.

The hard part is the allocation engine. It's built, and it's running.

Turning raw hours and dollars into per-door truth — across a dozen spreadsheet shapes — is the part nobody else has. Every view in all three products is one reduce over the same measured set.

Why it holds up

- **One data model.** There is no second copy of the numbers to drift from the first — the P&L reads the same entries the crew created.
- **Imports become entries.** A shop's existing workbook is interpreted into the same spine, so history reconciles too.
- **Tested money paths.** The rollup, allocation, and P&L engines carry unit tests that assert the reconciliation invariant.

PER-DOOR LABOR · ONE WEEK · ILLUSTRATIVE

RECONCILED ✓ TO THE GRAND TOTAL 96.0 h

ILLUSTRATIVE — SAMPLE BUILDINGS, NOT CUSTOMER DATA

A full property-maintenance operation, ported from Excel to live.

A real multi-building maintenance company runs Caliper Pro in production. Its entire hand-kept workflow — rent roll, labor spine, and per-building P&L — was interpreted straight from its spreadsheets and stood up live, with every hour reconciled to the door it was worked on.

44 tabs → 1

ONE WORKBOOK BECAME ONE LEDGER

11+ buildings

ACROSS FOUR CITIES

8–9 operators

VARIED RATES, MID-LOG OVERRIDES

Weekly • Sat

PAY PERIOD MATCHED, OR PAYROLL
DISAGREES

What the workbook looked like

- × Labor hand-split across properties in spreadsheet grids, weeks after the fact.
- × Reconciliation drift — "overpay" rows, negative balances, off-sheet "paid by" notes.
- × Pay logs, P&Ls, service logs, and inventories tangled across one file.

What runs now

- Every hour reconciled to a door; a per-building P&L that moves when a rate changes.
- Office and crew on one system — dispatch, timers, receipts, approvals.
- The design partner, the proving ground, and the first reference — an operating customer, not a hypothetical one.

Win the field, and the office data follows for free.

Most maintenance software is bought by the office and ignored by the crew. Caliper starts with the people creating the cost.

± THE ALLOCATION ENGINE

Turning raw hours and dollars into per-door truth — across a dozen spreadsheet shapes — is the defensible core. It exists, on real data, today.

≠ MEETS SHOPS WHERE THEY ARE

Caliper imports the exact spreadsheets companies already keep. No rip-and-replace, no data-entry wall — the reason maintenance software usually never gets adopted.

■ MOBILE-FIRST FOR THE CREW

The crew in the field are the ones who never had a tool. Voice, offline-safe, one thumb. Give them something that works in a stairwell, and every hour arrives already allocated.

Fragmented, spreadsheet-bound, and priced per door.

Caliper prices to the door, so the model *is* the market: every door under management is a unit of revenue, and the wedge is the cost line every one of those doors already carries.

▣ WHO IT'S FOR

Small-to-mid property-management companies that run their own in-house maintenance crews — past the spreadsheet, below the enterprise platforms built for institutional multifamily.

\$ PRICED PER DOOR

Published, not quoted. Nobody in this category posts pricing; Caliper does — set below the labor leakage the allocation engine surfaces in the first month.

/ ENTRY POINT

The pain begins where the spreadsheet breaks — the moment an operator can no longer hold the allocation in their head. That threshold is the qualifying question, and the first filter.

Where it expands

- **Per-seat, upward.** Crew seats land the account; office and owner seats carry the margin.
- **Enterprise.** Office parks and towers are the same buyer, one layer up — and a CAM reconciliation only measured labor can defend.
- **White-label.** A management company resells Caliper to the owners it serves — a channel, not a customer.
- **The benchmark.** Once enough shops run the ledger, Caliper knows what a job should cost — the one asset in this category that compounds.

Market framing is our own bottom-up view of the category — illustrative, not a forecast.

Everyone else coordinates the work. Nobody costs it.

The category is crowded at both ends and empty in the middle. Vendor-dispatch tools serve companies that outsource repairs; enterprise platforms serve institutional multifamily. Neither closes the loop between the hour worked and the door it was worked on.

CATEGORY	WHO THEY SERVE	WHAT THEY OWN	THE GAP
Coordination tools Property Meld · Latchel	Managers who outsource repairs	Vendor dispatch, resident comms	No in-house crew tools. Spend read from invoices, not the field.
Enterprise multifamily AppWork · Accolade	Institutional, centralized portfolios	Technician productivity, turns	Labor without materials. Enterprise-only. Quote-based pricing.
Systems of record Rent Manager · AppFolio · Yardi	Their installed base	Accounting, leases, trust	The field is an afterthought. We integrate — we don't compete.
Caliper Pro · Enterprise · Community	Operators with in-house crews, the estates they serve, and their residents	The allocation engine — labor + materials, per door — plus the resident layer	Published pricing. White-label. Built by the crew, for the crew.

We don't replace the accounting system — that fight is a decade long and a liability. We own the operational ledger it depends on, and we sync.

The building's community, not just its work orders.

Every tool in the landscape treats residents as ticket submitters. Caliper Community treats the building as a neighborhood — and it is the one thing a competitor can't migrate away. Switching software would mean unplugging the building from itself.

TODAY

Residents report a repair from a QR on their door — no app, no login — straight into the work-order pipeline. Verified residents follow it to done, read the building handbook, and reserve amenities.

NEXT

Residents reach their neighbors through pseudonymous, accountable messaging — so "can you turn the music down" never becomes a management call.

THE FLYWHEEL

01 · Residents join the building's layer

Free with Pro. Viral inside a building: one QR, every door.

02 · Small frictions resolve peer-to-peer

Fewer nuisance tickets and after-hours calls. Management sees less noise.

03 · Residents who feel at home stay longer

Lower turnover means fewer make-readies — turn labor Pro already measures per door.

04 · Only Caliper can price the retention

Both sides of the equation live in one ledger — the community and the labor it saves. Nobody else has both.

Built by the crew that had the problem.

Most maintenance software is built by people who have never turned a unit. Caliper started on a maintenance crew — with the spreadsheet that wouldn't reconcile, and founders who decided to fix it.

CO-FOUNDER

Gianni Arone

Came up on a property-maintenance crew — the timers, the receipts, the pay logs that never agreed. Taught himself to build, then built the system he needed. Owns product, architecture, and the allocation engine.

Also built **faraday.cam**, invited into Jason Calacanis's LAUNCH — Startup Tuneup, Cohort 38.

CO-FOUNDER

Declan Mulligan

A builder who ships. Designed and built **xmr.irish** — a fast, robust web product end to end — and co-founded **cbuy.ing** with Gianni.

This is the team's second product together; they've shipped as a pair before.

BACKED BY THE OPERATION IT WAS BUILT INSIDE

A working multi-building property-management company funded the build, contributed its entire hand-kept workflow, and runs Caliper in production today — the design partner, the proving ground, and the first reference.

From a working product to a paying one.

The build risk is behind us — the hard part, the allocation engine, exists and runs on real data. We're raising a pre-seed round to fund distribution: getting Caliper into the hands of the operators still reconciling by hand.

⚙ ENGINEERING

Rent Manager sync to GA, receipt OCR at scale, the pay-period lock and payroll export, Community messaging, and the reliability a system of record earns the right to be trusted with.

🏪 GO-TO-MARKET

The first sales motion — design partners to paying operators, the integration marketplace, and a published-pricing page that makes buying a decision, not a negotiation.

🛡 INFRASTRUCTURE & TRUST

Key management at multi-tenant scale, the security review a pay-data platform must pass, and the audit trail our buyers' owners will ask for.

What it buys

- **The first cohort of paying operators** — the thesis, priced and proven.
- **Rent Manager sync live** — distribution through an installed base that keeps its books elsewhere and dislikes its maintenance workflow.
- **The first white-label channel** — enough shops on the ledger to make the benchmark real.

Plans and milestones are targets, not guarantees — illustrative of intent, not projections of performance.

Labor, measured true.

Every hour, every receipt, every door — reconciled. Three products on one ledger, an operating customer, and the one number this category has never had.
